

Key Insights are as follows

- Higher attrition observed among employees with 1–5 years tenure and younger age groups (25–35).
- Attrition peaks within the first 2 years, then decline -> Suggests onboarding and early employee engagement may be key to retention.
- Sales Representatives and Laboratory Technicians show the highest attrition.
- Attrition is particularly concentrated in Job Levels 1–3, suggesting junior employees are more prone to leave — likely due to limited progression opportunities or job dissatisfaction.
- Employees working overtime have higher attrition.
- Departments like Sales and R&D show above-average turnover. They face the most attrition.
- Employees with longer promotion gaps (≥ 3 years) have lower attrition. Attrition risk is highest within 1–2 years since last promotion. This could mean that employees leave soon after being promoted, possibly when they realize the new role or workload doesn't meet expectations. After 3 years since the last promotion, attrition declines significantly — perhaps because those who remain are more stable, satisfied, or senior.
- Married employees exhibit lower attrition rates than single employees.
